Concluded Proof of Principle Projects funded by ITN

Restoration of glial glutamate transport to prevent posttraumatic stress and vulnerability to alcohol and marijuana use and relapse
Principal Investigator(s): Peter W. Kalivas, Ph.D. [5]
Medical University of South Carolina [4]

Although we used NAC in a pilot study with success in treating Veterans with comorbid PTSD/SUDs, it is unknown if using NAC either prophylactically, or immediately after a stressful experience can prevent vulnerability to developing PTSD or comorbid PTSD/SUDs. We propose preclinical validation for the use of NAC prophylactically or immediately post-combat stress to reduce the neurological sequelae that establishes PTSD and PTSD/SUDs comorbidity. 1) We have expanded the validity of the animal model by associating an odor with the immobilization stress, and we use exposure to the odor to provoke relapse (reinstated lever pressing) in animals trained to self-administer drug. 2) We will treat rats with N-acetylcysteine either during or immediately after exposure to immobilization stress, and determine if this prevents stress-induced augmented acquisition of drug self-administration and the capacity of the stress-associated odor to reinstate drug seeking. Simultaneously, we will validate that NAC has normalized EAAT2 levels, a key neurological action of NAC’s protective effects. 3) We recently developed an animal model of rat i.v. self-administration and reinstatement of the key constituents of marijuana, δ9-tetrahydrocannabinol and cannabidiol. Marijuana abuse is a substantially larger problem in Veterans with comorbid PTSD and SUDs than cocaine abuse, making use of this model for the determining the biological basis of PTSD/SUDs comorbidity more clinically relevant.

### Topiramate Treatment of Hazardous and Harmful Alcohol Use in Veterans with TBI

**Principal Investigator(s):** Steven L. Batki, M.D. [8].  
**Northern California Institute for Research and Education** [9]

<table>
<thead>
<tr>
<th>Lay Abstract</th>
<th>The project aims to: 1) Obtain a preliminary assessment of the effectiveness of topiramate in reducing alcohol use and TBI symptoms in veterans with TBI and hazardous or harmful alcohol use; 2) Assess the safety/tolerability of topiramate in these patients; 3) Assess the feasibility of recruitment/retention for topiramate treatment; and 4) To inform the design of a planned subsequent larger controlled trial of topiramate.</th>

PTSD, Cocaine, Substance Use Disorder, Animal Model, Addiction, Angiotensin, Captoril, Candesartan

Date concluded 8/31/2016

Treatment Type Substance Abuse: Cocaine

Target population Rat Studies
Conditioned stress prevents cue-primed cocaine reinstatement only in stress-responsive rats [45]

Epigenetic modulation of interactions between fear and substance abuse
Principal Investigator(s): Kennon M. Lattal, Ph.D. [46] Oregon Health & Science University [16]

Lay Abstract
Study/Product Aim(s): To determine whether potentiation of extinction by an HDAC3 inhibitor in a rodent model of PTSD weakens the ability of cues associated with trauma to cause relapse of drug seeking. To determine whether potentiation of extinction of drug seeking by an HDAC3 inhibitor protects extinguished drug seeking from reinstatement induced by cues associated with trauma.

Keywords
substance abuse, fear conditioning, HDAC3 inhibitor, RGFP966, extinction of fear

Date concluded 9/30/2014

Treatment Type Pharmacologic: HDAC3 Inhibitor called RGFP966

Target population Mouse and rat studies

Endogenous Modulators Suppress Substance Abuse Disorders Associated with Chronic Stress
Lay Abstract

Study/Product Aim(s): • Establish a preclinical model of PTSD vulnerability to methamphetamine (METH) self administration and seeking. • Demonstrate effects of oxytocin and carbetocin on reinstatement of meth seeking after chronic stress. • Examine neurobiological and epigenetic adaptations in the brains of METH seeking rats pre-exposed to chronic stress and treated with oxytocin or carbetocin.
